WEEKLY ELECTRICITY MARKET ANALYSIS

29 April - 5 May 2012

Summary

As shown in figure 1, Tasmania recorded the highest average weekly price of \$38/MWh (the next highest was \$32/MWh). As been the case for much of the year, spot prices in Tasmania during the week were around \$50/MWh (considerably higher than all other regions) during the minimum load period in the early hours of the morning. On Saturday, the spot price in Tasmania was around \$50/MWh for most trading intervals from 12.30 am to 4 pm, again considerably higher than all other regions.

Spot market prices

Figure 1 sets out the volume weighted average (VWA) prices for the week 29 April to 5 May and the 11/12 financial year to date (YTD) across the NEM. It compares these prices with price outcomes from the previous week and year to date respectively.

Figure 1: Volume weighted average spot price by region (\$/MWh)

	Qld	NSW	VIC	SA	Tas
Average price for 29 Apr – 5 May 2012	29	32	32	32	38
% change from previous week*	-5	-5	-4	6	10
11/12 financial YTD	30	30	27	32	33
% change from 10/11 financial YTD **	-15	-34	-4	-25	8

*The percentage change between last week's average spot price and the average price for the previous week. Calculated on VWA prices prior to rounding.

**The percentage change between the average spot price for the current financial year and the average spot price for the previous financial year. Percentage changes are calculated on VWA prices prior to rounding.

Longer term market trends are attached in Appendix A^1 .

Financial markets

Figures 2 to 9 show futures contract² prices traded on the Australian Securities Exchange (ASX) as at close of trade on Monday 7 May 2012. Figure 2 shows the base futures contract prices for the next three calendar years, and the average over these three years. Also shown are percentage changes³ from the previous week.

³ Calculated on prices prior to rounding.

¹ Monitoring the performance of the wholesale market is a key part of the AER's role and an overview of the market's performance in the long term is provided on the AER website. Long-term statistics can be found there on, amongst other things, demand, spot prices, contract prices and frequency control ancillary services prices. To access this information go to

www.aer.gov.au -> Monitoring, reporting and enforcement -> Electricity market reports -> Long-term analysis. ² Futures contracts traded on the ASX are listed by d-cyphaTrade (<u>www.d-cyphatrade.com.au</u>). A futures

² Futures contracts traded on the ASX are listed by d-cyphaTrade (<u>www.d-cyphatrade.com.au</u>). A futures contract is typically for one MW of electrical energy per hour based on a fixed load profile. A base load profile is defined as the base load period from midnight to midnight Monday to Sunday over the duration of the contract quarter. A peak load profile is defined as the peak-period from 7 am to 10 pm Monday to Friday (excluding Public holidays) over the duration of the contract quarter.

^{*}The daily volume scale for South Australia is smaller than for other regions to reflect the lower liquidity in the market in South Australia.

Spot market forecasting variations

The AER is required under the National Electricity Rules to determine whether there is a significant variation between the forecast spot price published by the Australian Energy Market Operator (AEMO) and the actual spot price and, if there is a variation, state why the AER considers the significant price variation occurred. It is not unusual for there to be significant variations as demand forecasts vary and as participants react to changing market conditions. There were 36 trading intervals throughout the week where actual prices varied significantly from forecasts⁵. This compares to the weekly average in 2011 of 78 counts and the average in 2010 of 57. Reasons for these variances are summarised in Figure 10⁶.

	Availability	Demand	Network	Combination
% of total above forecast	0	46	0	0
% of total below forecast	48	4	0	2

 ⁵ A trading interval is counted as having a variation if the actual price differs significantly from the forecast price either four or 12 hours ahead.
 ⁶ The table summarises (as a percentage) the number of times when the actual price differs significantly from

⁶ The table summarises (as a percentage) the number of times when the actual price differs significantly from the forecast price four or 12 hours ahead and the major reason for that variation. The reasons are classified as availability (which means that there is a change in the total quantity or price offered for generation), demand forecast inaccuracy, changes to network capability or as a combination of factors (when there is not one dominant reason). An instance where both four and 12 hour ahead forecasts differ significantly from the actual price will be counted as two variations.

Demand and bidding patterns

The AER reviews demand, network limitations and generator bidding as part of its market monitoring to better understand the drivers behind price variations. Figure 11 shows the weekly change in total available capacity at various price levels during peak periods⁷. For example, in Queensland 11 MW more capacity was offered at prices under \$20/MWh this week compared to the previous week. Also included is the change in average demand during peak periods, for comparison.

MW	<\$20/MWh	Between \$20 and \$50/MWh	Total availability	Change in average demand
QLD	11	-139	-43	29
NSW	321	147	950	331
VIC	-154	520	-228	325
SA	193	57	214	64
TAS	-136	-62	-241	72
TOTAL	235	523	652	821

Figure 11: Changes in available generation and average demand compared to the previous week during peak periods

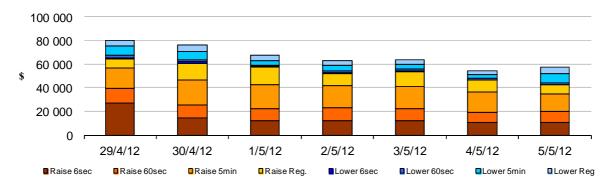

Ancillary services market

The total cost of frequency control ancillary services (FCAS) on the mainland for the week was \$395 000 or less than one per cent of energy turnover on the mainland.

The total cost of FCAS in Tasmania for the week was \$68,000 or less than one per cent of energy turnover in Tasmania.

Figure 12 shows the daily breakdown of cost for each FCAS for the NEM.

Figure 12: Daily frequency control ancillary service cost

Australian Energy Regulator May 2012

⁷ A peak period is defined as between 7 am and 10 pm on weekdays.
