

WEEKLY ELECTRICITY MARKET ANALYSIS

AUSTRALIAN ENERGY
REGULATOR

14 – 20 April 2013

Spot market prices

Figure 1 sets out the volume weighted average (VWA) prices for 14 to 20 April 2013 and the 12/13 financial year to date (YTD) across the NEM. It compares these prices with price outcomes from the previous week and year to date respectively.

Figure 1: Volume weighted average spot price by region (\$/MWh)

	QLD	NSW	VIC	SA	TAS
Average price for 14 Apr - 20 Apr 2013	59	57	54	71	46
% change from previous week*	7	5	3	1	0
12-13 financial YTD	72	56	61	65	49
% change from 11-12 financial YTD**	142	88	126	100	51

*The percentage change between last week's average spot price and the average price for the previous week. Calculated on VWA prices prior to rounding.

**The percentage change between the average spot price for the current financial year and the average spot price for the previous financial year. Percentage changes are calculated on VWA prices prior to rounding.

Further information is provided in Appendix A when the spot price exceeds three times the weekly average and is above \$250/MWh or less than -\$100/MWh. Longer term market trends are attached in Appendix B.¹

Financial markets

Figures 2 to 9 show futures contract² prices traded on the Australian Securities Exchange (ASX) as at close of trade on Friday 19 April 2013. Figure 2 shows the base futures contract prices for the next three calendar years, and the average over these three years. Also shown are percentage changes³ from the previous week.

Figure 2: Base calendar year futures contract prices (\$/MWh)

	QLD		NSW		VIC		SA	
Calendar Year 2014	55 (15)	-1%	54 (15)	-1%	50	0%	56	0%
Calendar Year 2015	49	-2%	47	-2%	44	0%	49 (10)	-1%
Calendar Year 2016	51	0%	52	0%	50	0%	63	0%
Three year average	51	-1%	51	-1%	48	0%	56	0%

A number in brackets denotes the number of trades in the product.

¹ Monitoring the performance of the wholesale market is a key part of the AER's role and an overview of the market's performance in the long term is provided on the AER website. Long-term statistics can be found there on, amongst other things, demand, spot prices, contract prices and frequency control ancillary services prices. To access this information go to www.aer.gov.au -> Australian energy industry -> Performance of the energy sector

² Futures contracts traded on the ASX are listed by d-cyphaTrade (www.d-cyphatrade.com.au). A futures contract is typically for one MW of electrical energy per hour based on a fixed load profile. A base load profile is defined as the base load period from midnight to midnight Monday to Sunday over the duration of the contract quarter. A peak load profile is defined as the peak-period from 7 am to 10 pm Monday to Friday (excluding Public holidays) over the duration of the contract quarter.

³ Calculated on prices prior to rounding.

Figure 3 shows the \$300 cap contract price for Q1 2014 and calendar year 2014 and the percentage change⁴ from the previous week.

Figure 3: \$300 cap contract prices (\$/MWh)

	QLD		NSW		VIC		SA	
Q1 2014	13	0%	8 (5)	0%	10 (5)	-3%	16	0%
2014	6	0%	4	-2%	5	-3%	8	0%

Source: d-cyphaTrade/ASX www.d-cyphatrade.com.au

Figure 7: New South Wales Q1 2011, 2012, 2013 and 2014

Source: d-cyphaTrade/ASX www.d-cyphatrade.com.au

Figure 8: Victoria Q1 2011, 2012, 2013 and 2014

Source: d-cyphaTrade/ASX www.d-cyphatrade.com.au

Figure 9: South Australia Q1 2011, 2012, 2013 and 2014

Source: d-cyphaTrade/ASX www.d-cyphatrade.com.au

The daily volume scale for South Australia is smaller than for other regions to reflect the lower liquidity in the market in South Australia.

Spot market forecasting variations

The AER is required under the National Electricity Rules to determine whether there is a significant variation between the forecast spot price published by the Australian Energy Market Operator (AEMO) and the actual spot price and, if there is a variation, state why the AER considers the significant price variation occurred. It is not unusual for there to be significant variations as demand forecasts vary and as participants react to changing market conditions. There were 34 trading intervals throughout the week where actual prices varied significantly from forecasts.⁵ This compares to the weekly average in 2012 of 60 counts and the average in 2011 of 78. Reasons for these variances are summarised in Figure 10⁶.

Figure 10: Reasons for variations between forecast and actual prices

	Availability	Demand	Network	Combination
% of total above forecast	6	61	2	0
% of total below forecast	9	16	0	5

The total may not equal 100% due to rounding

Demand and bidding patterns

The AER reviews demand, network limitations and generator bidding as part of its market monitoring to better understand the drivers behind price variations. Figure 11 shows the weekly change in total available capacity at various price levels during peak periods⁷. For example, in Queensland 78 MW less capacity was offered at prices under \$20/MWh this week compared to the previous week. Also included is the change in average demand during peak periods, for comparison.

Figure 11: Changes in available generation and average demand compared to the previous week during peak periods

MW	<\$20/MWh	Between \$20 and \$50/MWh	Total availability	Change in average demand
QLD	-78	-59	420	172
NSW	-264	-13	-645	-61
VIC	-22	-106	-103	-85
SA	-69	-84	-115	-173
TAS	30	32	-3	59
TOTAL	-403	-230	-446	-88

⁵ A trading interval is counted as having a variation if the actual price differs significantly from the forecast price either four or 12 hours ahead.

⁶ The table summarises (as a percentage) the number of times when the actual price differs significantly from the forecast price four or 12 hours ahead and the major reason for that variation. The reasons are classified as availability (which means that there is a change in the total quantity or price offered for generation), demand forecast inaccuracy, changes to network capability or as a combination of factors (when there is not one dominant reason). An instance where both four and 12 hour ahead forecasts differ significantly from the actual price will be counted as two variations.

⁷ A peak period is defined as between 7 am and 10 pm on weekdays.

Ancillary services market

The total cost of frequency control ancillary services (FCAS) on the mainland for the week was \$221 000 or less than one per cent of energy turnover on the mainland.

The total cost of FCAS in Tasmania for the week was \$56 500 or less than one per cent of energy turnover in Tasmania.

Figure 12 shows the daily breakdown of cost for each FCAS for the NEM.

Figure 12: Daily frequency control ancillary service cost

**Australian Energy Regulator
April 2013**

14 – 20 April 2013

South Australia:

There was one occasion where the spot price in South Australia was greater than three times the South Australia weekly average price of \$71/MWh and above \$250/MWh.

Monday, 15 April

7:30 AM	Actual	4 hr forecast	12 hr forecast
Price (\$/MWh)	2148.91	74.14	77.02
Demand (MW)	1283	1305	1351
Available capacity (MW)	1456	1491	1494

Conditions at the time saw demand and available capacity close to that forecast.

At 10.56 pm the previous evening, AGL rebid 100 MW of capacity across two B units from around \$200/MWh to \$12 600/MWh for the 7.30 am to 2 pm trading intervals inclusive. The reason given was “chg in forecast::increase vs 22:01pd SA \$200 vs \$90”.

At 7.05 am a constraint managing the planned outage of the Buronga to Balranald to Darlington Pt 220 kV line in New South Wales was invoked. This constraint avoids the overloading of the Horsham to Waubra 220 kV line on the trip of Bendigo to Kerang 220 kV line (in Victoria) by reducing imports into South Australia across Murraylink. At 7.10 am the constraint bound which saw the import limit into South Australia fall from 220 MW at 7.05 am to 101 MW at 7.10 am. This reduction in the import limit was not forecast. This step change in imports required a sudden increase in South Australian generation in five minutes. With other generation either ramp rate limited or offline, Torrens Island B unit one set the 5-minute price at \$12 600/MWh at 7.10 am.

There was no other significant rebidding.
