Electricity Report

AUSTRALIAN ENERGY REGULATOR

21 – 27 June 2020

Weekly Summary

Weekly volume weighted average (VWA) prices ranged from $30/MWh in Queensland up to $49/MWh in South Australia. Q2 2020 quarter to date VWA prices are tracking from $32/MWh to $46/MWh, compared to $79/MWh to $102/MWh a year ago.

In South Australia, lower wind and solar availability throughout the week saw gas generators offer around 700 MW at low prices for most of the week.

In contract markets, the price for Q1 2021 base and cap contracts dipped again, following a slight decline since the start of June.

Purpose

The AER is required to publish the reasons for significant variations between forecast and actual price and is responsible for monitoring activity and behaviour in the National Electricity Market. The Electricity Report forms an important part of this work. The report contains information on significant price variations, movements in the contract market, together with analysis of spot market outcomes and rebidding behaviour. By monitoring activity in these markets, the AER is able to keep up to date with market conditions and identify compliance issues.

Spot market prices

Figure 1 shows the spot prices that occurred in each region during the week 21 to 27 June 2020.

Figure 1: Spot price by region ($/MWh)

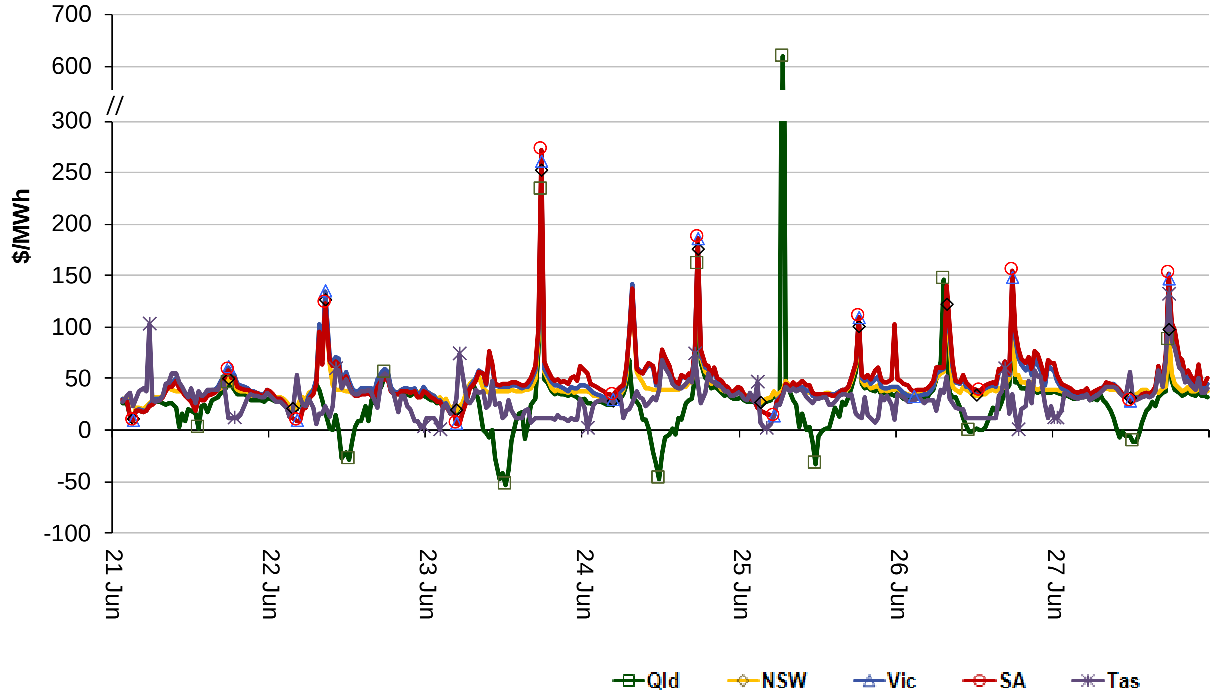

Figure 2 shows the volume weighted average (VWA) prices for the current week (with prices shown in Table 1) and the preceding 12 weeks, as well as the VWA price over the previous 3 financial years.

Figure 2: Volume weighted average spot price by region ($/MWh)

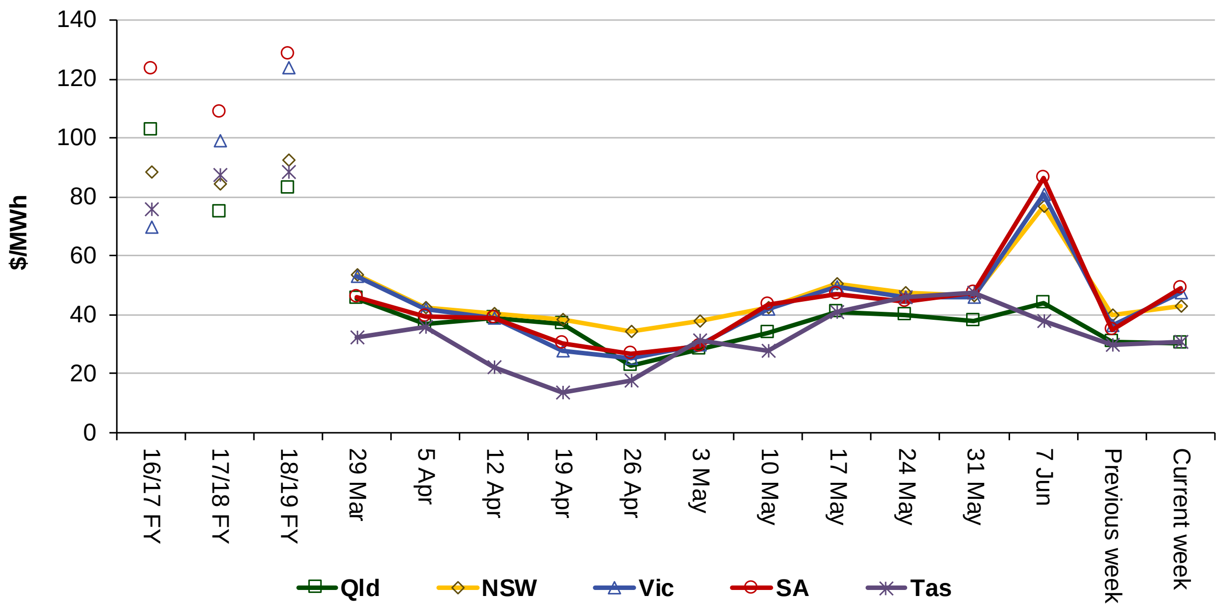

Table 1: Volume weighted average spot prices by region ($/MWh)

Region	Qld	NSW	Vic	SA	Tas
Current week	30	43	48	49	31
Q2 2019 (QTD)	79	87	102	96	100
Q2 2020 (QTD)	36	46	44	44	32
18-19 financial YTD	83	93	124	129	89
19-20 financial YTD	56	79	85	73	56

Longer-term statistics tracking average spot market prices are available on the AER website.

Spot market price forecast variations

The AER is required under the National Electricity Rules to determine whether there is a significant variation between the forecast spot price published by the Australian Energy Market Operator (AEMO) and the actual spot price and, if there is a variation, state why the AER considers the significant price variation occurred. It is not unusual for there to be significant variations as demand forecasts vary and participants react to changing market conditions. A key focus is whether the actual price differs significantly from the forecast price either four or 12 hours ahead. These timeframes have been chosen as indicative of the time frames within which different technology types may be able to commit (intermediate plant within four hours and slow start plant within 12 hours).

There were 210 trading intervals throughout the week where actual prices varied significantly from forecasts. This compares to the weekly average in 2019 of 204 counts and the average in 2018 of 199. Reasons for the variations for this week are summarised in Table 2. Based on AER analysis, the table summarises (as a percentage) the number of times when the actual price differs significantly from the forecast price four or 12 hours ahead and the major reason for that variation. The reasons are classified as availability (which means that there is a change in the total quantity or price offered for generation), demand forecast inaccuracy, changes to network capability or as a combination of factors (when there is not one dominant reason). An instance where both four and 12 hour ahead forecasts differ significantly from the actual price will be counted as two variations.

Table 2: Reasons for variations between forecast and actual prices

	Availability	Demand	Network	Combination
% of total above forecast	7	17	0	3
% of total below forecast	10	53	0	9

Note: Due to rounding, the total may not be 100 per cent.

Generation and bidding patterns

The AER reviews generator bidding as part of its market monitoring to better understand the drivers behind price variations. Figure 3 to Figure 7 show the total generation dispatched and the amounts of capacity offered within certain price bands for each 30 minute trading interval in each region.

Figure 3: Queensland generation and bidding patterns

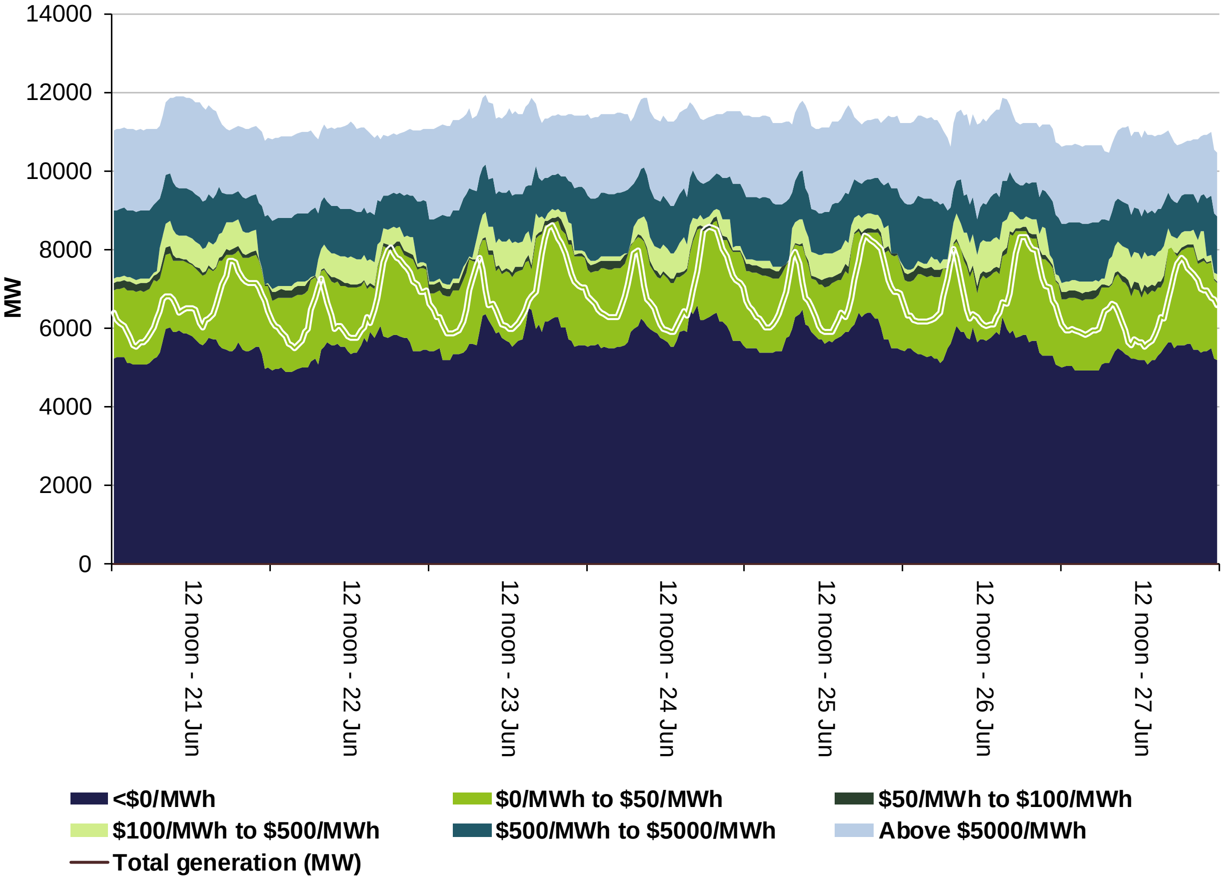

Figure 4: New South Wales generation and bidding patterns

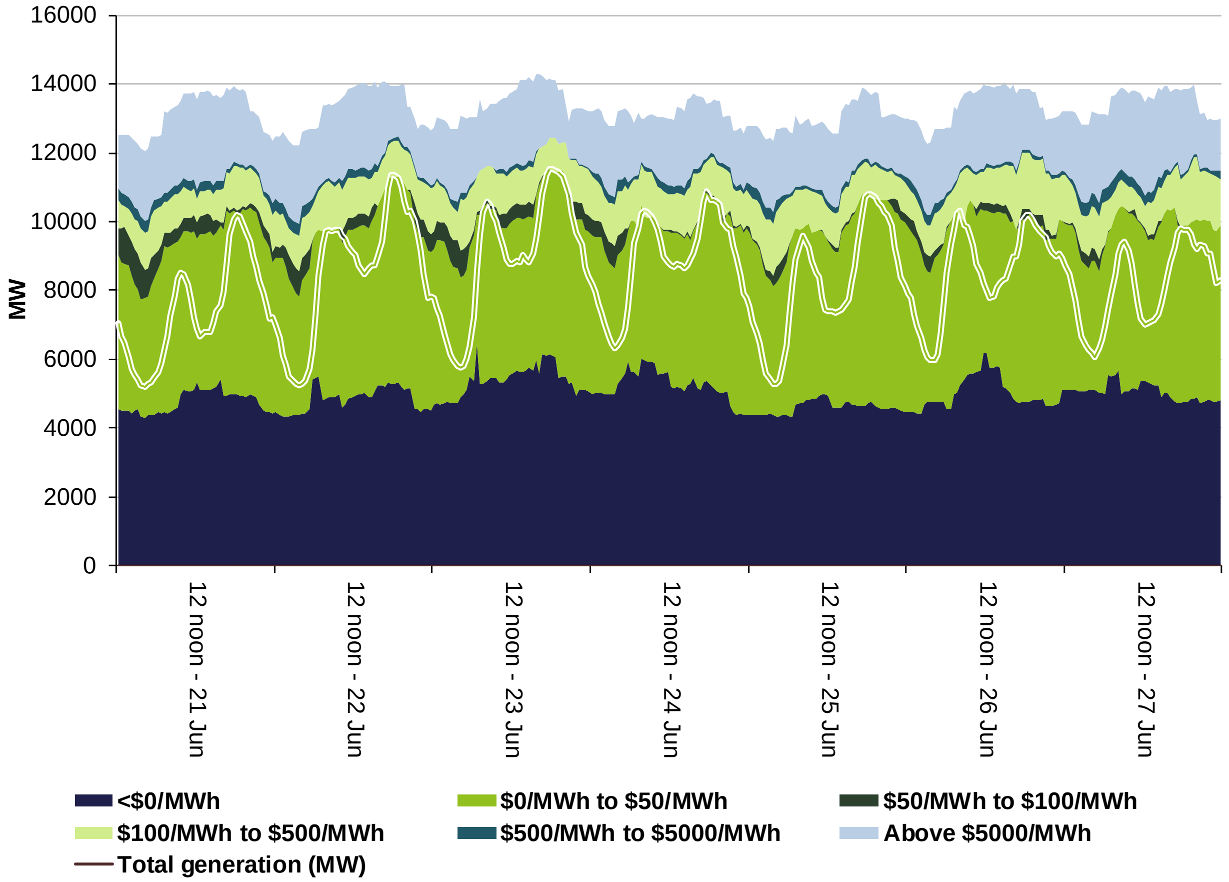

Figure 5: Victoria generation and bidding patterns

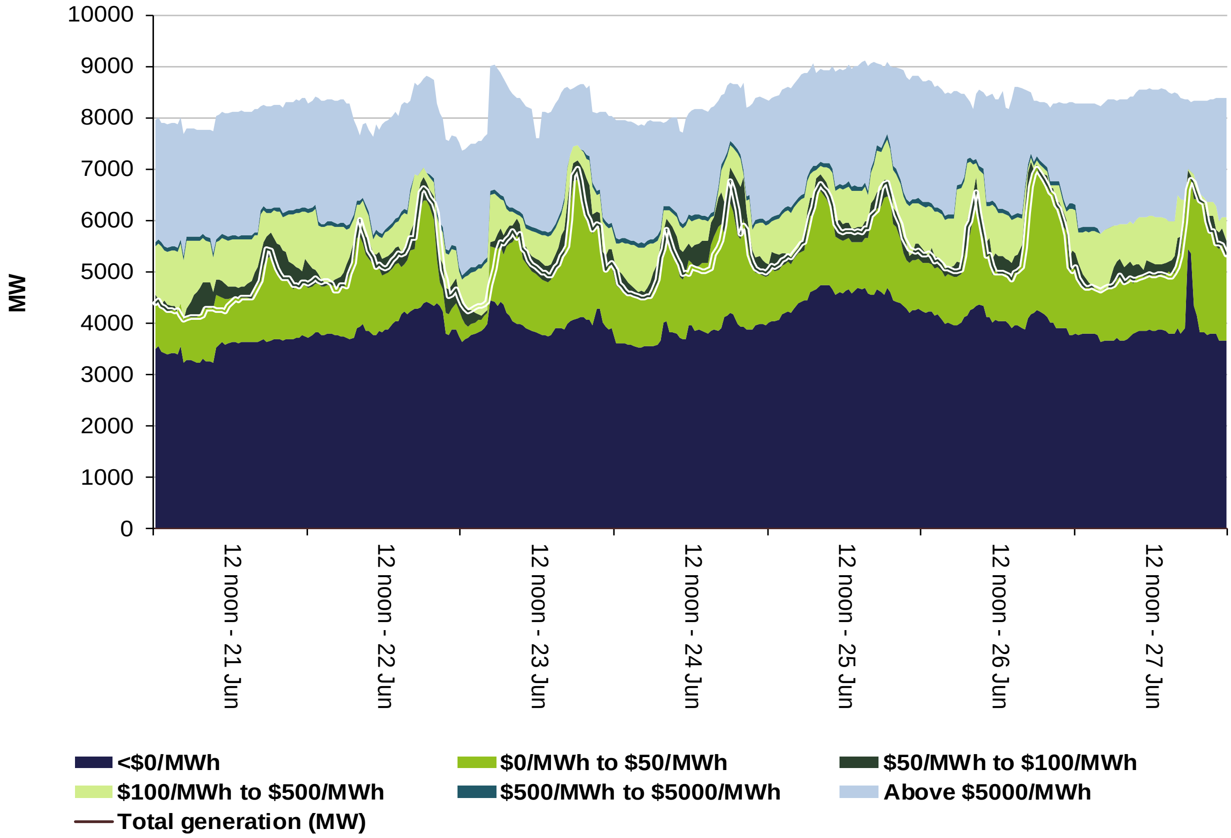

Figure 6: South Australia generation and bidding patterns

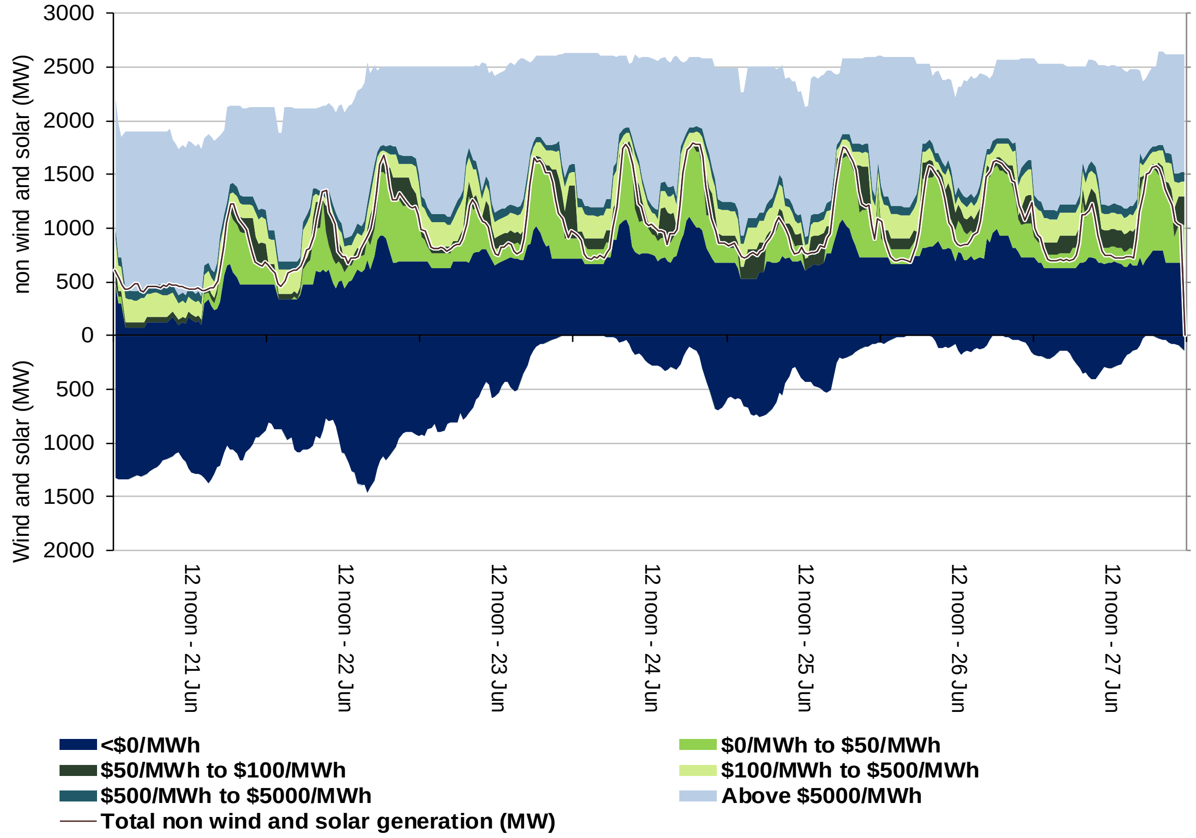

Figure 7: Tasmania generation and bidding patterns

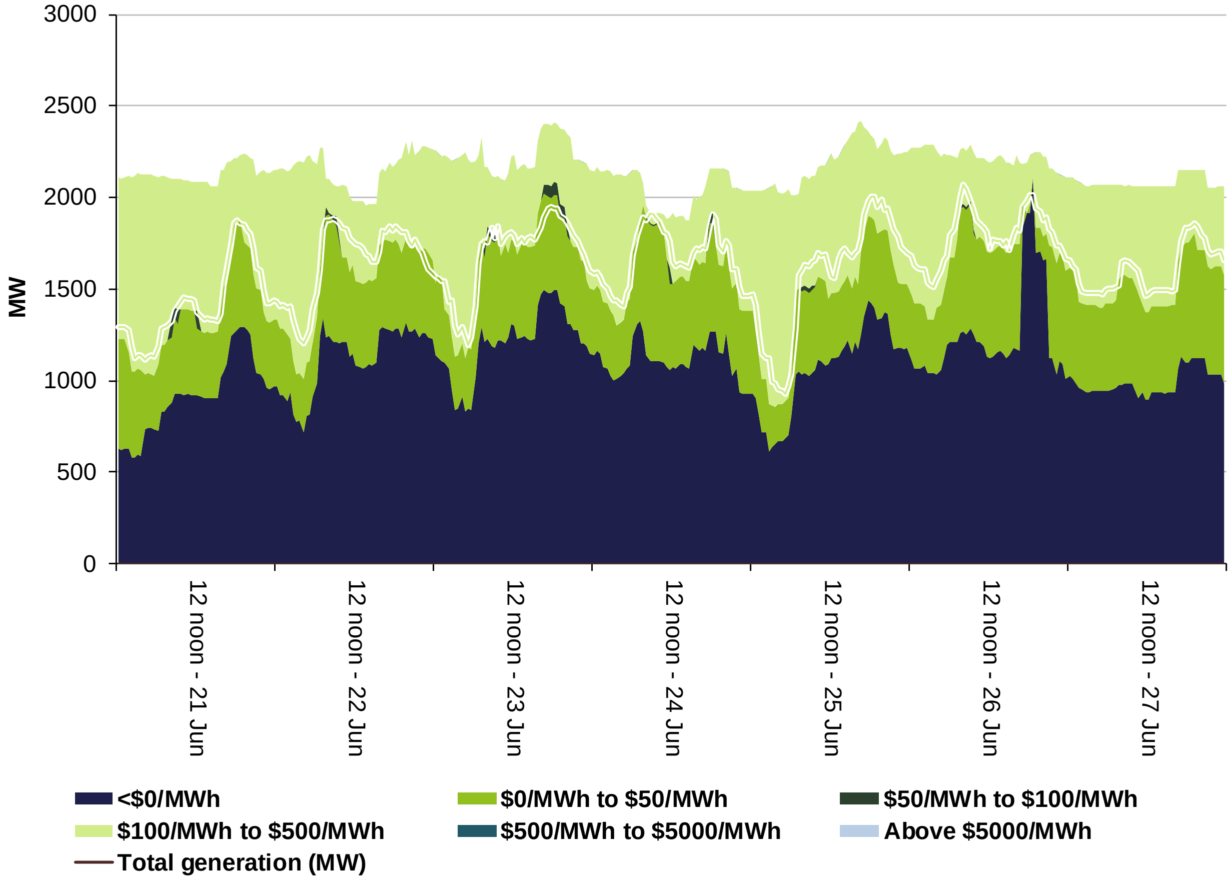


Frequency control ancillary services markets

Frequency control ancillary services (FCAS) are required to maintain the frequency of the power system within the frequency operating standards. Raise and lower regulation services are used to address small fluctuations in frequency, while raise and lower contingency services are used to address larger frequency deviations. There are six contingency services:

- fast services, which arrest a frequency deviation within the first 6 seconds of a contingent event (raise and lower 6 second)
- slow services, which stabilise frequency deviations within 60 seconds of the event (raise and lower 60 second)
- delayed services, which return the frequency to the normal operating band within 5 minutes (raise and lower 5 minute) at which time the five minute dispatch process will take effect.

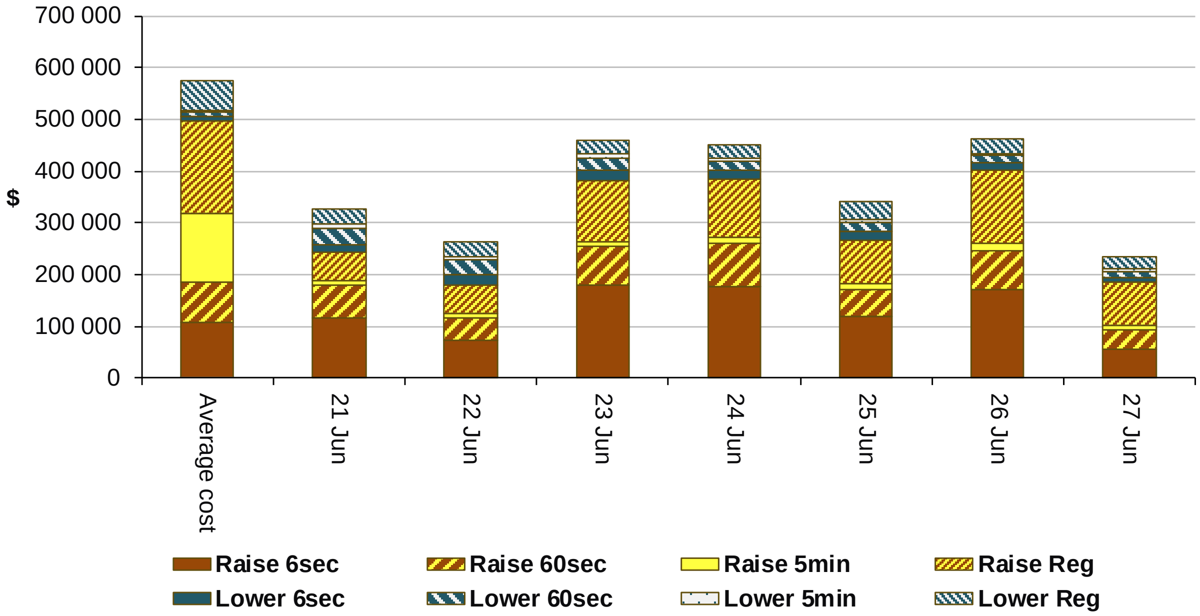
The Electricity Rules stipulate that generators pay for raise contingency services and customers pay for lower contingency services. Regulation services are paid for on a "causer pays" basis determined every four weeks by AEMO.

The total cost of FCAS on the mainland for the week was $2 402 000 or less than 2 per cent of energy turnover on the mainland.

The total cost of FCAS in Tasmania for the week was $134 000 or around 2 per cent of energy turnover in Tasmania.

Figure 8 shows the daily breakdown of cost for each FCAS for the NEM, as well as the average cost since the beginning of the previous financial year.

Figure 8: Daily frequency control ancillary service cost



Detailed market analysis of significant price events

Mainland

There was one occasion where the mainland price was greater than three times the New South Wales weekly average price of $43/MWh and above $250/MWh. The New South Wales price is used as a proxy for the mainland.

Tuesday, 23 June

Table 3: Price, Demand and Availability

Time	Price ($/MWh)			Demand (MW)			Availability (MW)		
	Actual	4 hr forecast	12 hr forecast	Actual	4 hr forecast	12 hr forecast	Actual	4 hr forecast	12 hr forecast
6 pm	252.32	120.62	60.33	28 689	28 133	28 188	36 828	37 312	37 321

Across the mainland regions, demand was 555 MW higher than forecast while availability was 483 MW lower than forecast, four hours prior. Lower than forecast availability was due to lower than forecast wind generation that was mostly offered at low prices. Rebids also removed 166 MW of capacity at Uranquinty due to an unplanned outage extension, and 90 MW at Callide C due to a mill trip.

The combination of higher than forecast demand and lower than forecast availability saw prices settle at around $290/MWh for most of the trading interval.

Queensland

There was one occasion where the spot price in Queensland was greater than three times the Queensland weekly average price of $30/MWh and above $250/MWh.

Thursday, 25 June

Table 4: Price, Demand and Availability

Time	Price ($/MWh)			Demand (MW)			Availability (MW)		
	Actual	4 hr forecast	12 hr forecast	Actual	4 hr forecast	12 hr forecast	Actual	4 hr forecast	12 hr forecast
7 am	619.83	37.85	37.76	7020	6864	6887	11 440	11 393	11 359

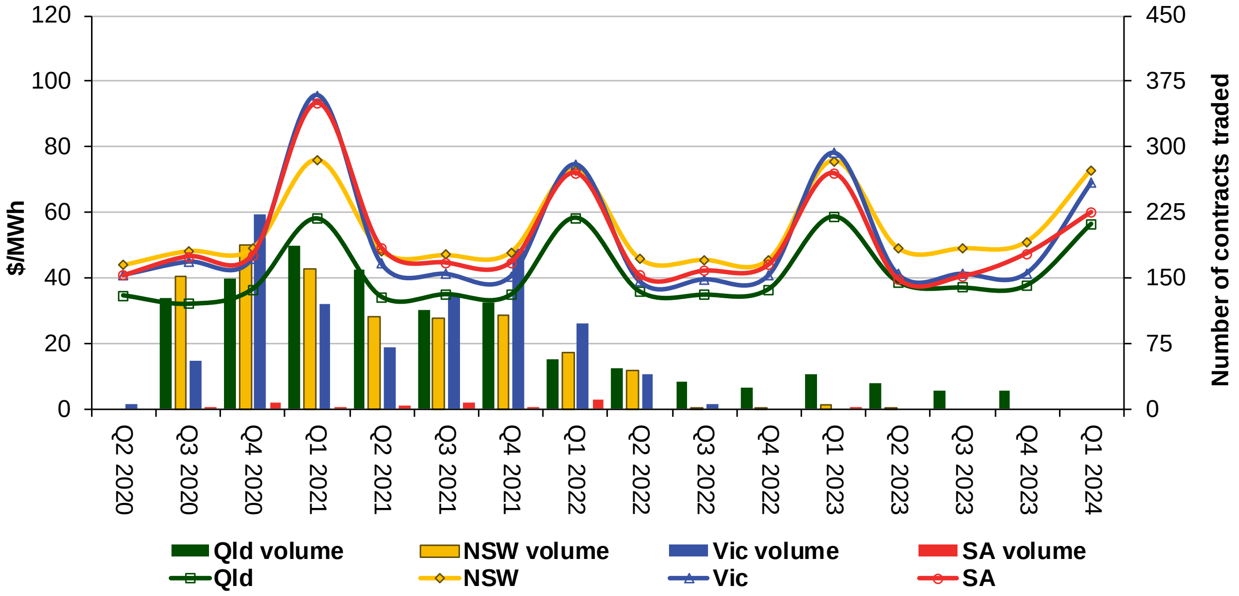
Demand was 156 MW higher than forecast and availability was 47 MW higher than forecast, four hours prior.

Over the trading interval demand increased by nearly 400 MW. At 7 am, with most units at Stanwell, Oakey and Millmerran being ramp up-constrained or trapped in FCAS, the dispatch price increased to $3500/MWh for one dispatch interval.

Financial markets

Figure 9 shows for all mainland regions the prices for base contracts (and total traded quantities for the week) for each quarter for the next four financial years.

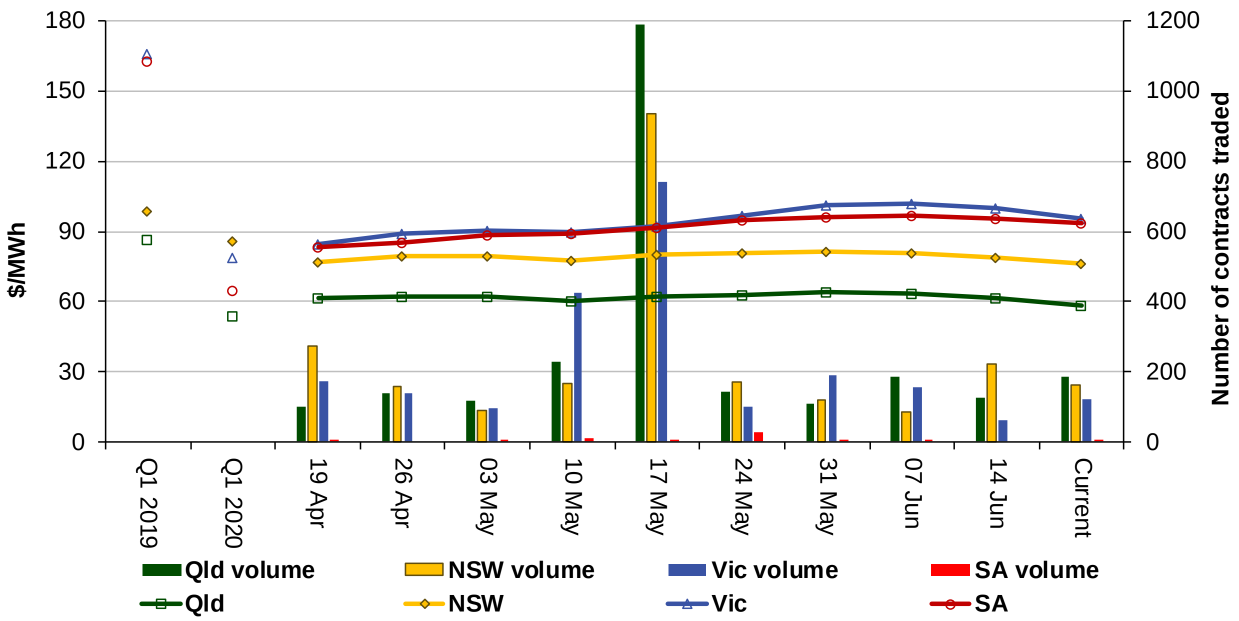
Figure 9: Quarterly base future prices Q2 2020 – Q1 2024



Source. ASXEnergy.com.au

Figure 10 shows how the price for each regional Q1 2021 base contract has changed over the last 10 weeks (as well as the total number of trades each week). The closing Q1 2019 and Q1 2020 prices are also shown. The AER notes that data for South Australia is less reliable due to very low numbers of trades. The high volume of trades in Figure 10 is a result of the conversion of base load options to base future contracts on 19 May 2020.

Figure 10: Price of Q1 2021 base contracts over the past 10 weeks (and the past 2 years)



Note. Base contract prices are shown for each of the current week and the previous 9 weeks, with average prices shown for periods 1 and 2 years prior to the current year.

Figure 11 shows how the price for each regional Q1 2021 cap contract has changed over the last 10 weeks (as well as the total number of trades each week). The closing Q1 2019 and Q1 2020 prices are also shown.
