### 12 - 18 June 2016

# **Weekly Summary**

Prices across most markets were relatively stable, with the exception of Victoria where prices rose by 19 per cent. In Adelaide, MOS (balancing gas) payments were high on a number of days which were likely a result of pipeline issues on SEAGas, gas power generation forecasting and the profiling of gas requirements.

# Long term statistics and explanatory material

The AER has published an <u>explanatory note</u> to assist with interpreting the data presented in its weekly gas market reports. The AER also publish a range of <u>longer term statistics</u> on the performance of the gas sector including gas prices, production, pipeline flows and consumer demand.

### **Market overview**

Figure 1 sets out the average daily prices (\$/GJ) for the current week, and demand levels, compared to historical averages. Regions shown include the Victorian Declared Wholesale Market (VGM or Victorian gas market) and for the Sydney (SYD), Adelaide (ADL) and Brisbane (BRI) Short Term Trading Market hubs (STTM). Price and demand information is also shown for the voluntary Wallumbilla and Moomba Gas Supply Hubs (GSH).

Figure 1: Average daily prices and demand – all markets (\$/GJ, TJ)<sup>1</sup>

	Victoria		Sy	dney	lney Adelaide Brisbane Wallumbill		umbilla	Moomba				
	Price	Demand	Price	Demand	Price	Demand	Price	Demand	Price	Quantity	Price	Quantity
12 Jun - 18 Jun 2016	7.21	884	7.17	264	7.50	79	7.03	90	7.18	123	-	-
% change from previous week	19	6	0	-1	-2	1	-8	-3	4	19	-	-
15-16 financial YTD	4.68	544	4.84	236	5.54	60	4.50	83	4.12	7251	-	-
% change from previous financial YTD	29	0	41	-2	48	-4	94	-36	50	146	-	-

Average daily quantities are displayed for each region, with the exception of Gas Supply Hubs (GSH). The weighted average daily imbalance price applies for Victoria. The prices shown for the GSH in Wallumbilla and Moomba are volume weighted average prices for all products traded across the period. The total quantity contributing to the weighted price is displayed for these GSH.

Figure 2 illustrates the daily prices in each gas market, as defined in figure 1.

Figure 2: Daily gas market prices (\$/GJ)

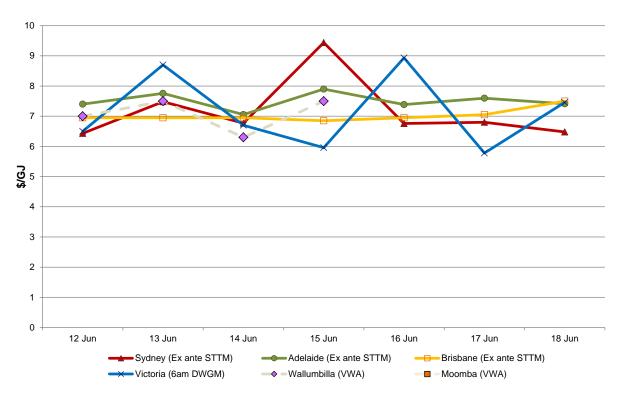

Figure 3 compares average ancillary market payments (VGM) and balancing gas service payments (STTM) against historical averages.

Figure 3: Average ancillary payments (\$000)

	Victoria Ancillary Payments*	Sydney MOS	Adelaide MOS	<b>Brisbane</b> MOS
12 Jun - 18 Jun 2016	-	23.65	67.03	0.93
% change from previous week	-	-7	97	-32
15-16 financial YTD		27.54	11.10	1.55
% change from previous financial YTD		70	-16	-10

<sup>\*</sup> Ancillary payments reflect the compensation costs for any additional injections offered at a price higher than the market price. Note: only positive ancillary payments, reflecting system constraints will be shown here.

More detailed analysis on the VGM is provided in section 1.

Figure 4 shows the quantity and volume weighted prices of products traded in the Gas Supply Hub locations at Wallumbilla and Moomba.

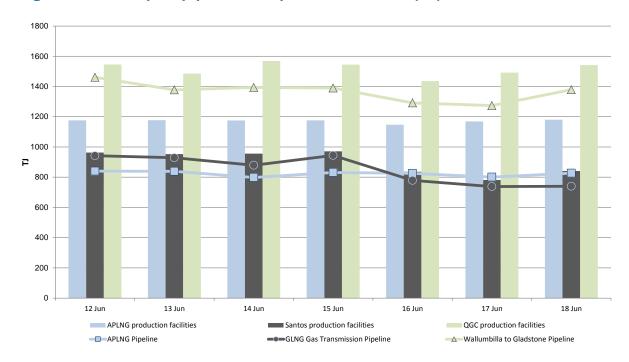

Figure 4: Gas supply hub products traded for the current week (\$/GJ, TJ)\*

	RBP		SV	VQP	N	IAP	MSP		QGP	
	VWA price	Quantity								
Balance of day	-	-	7.28	35.0	-	-	-	-	-	-
Daily	7.90	8.0	7.20	57.0	-	-	-	-	-	-
Day ahead	-	-	6.74	23.0	-	-	-	-	-	-
Weekly	-	-	-	-	-	-	-	-	-	-
Monthly	-	-	-	-	-	-	-	-	-	-

<sup>\*</sup> Non-netted products are not shown here. For information about these products, refer to figure 6.1.

Figure 5 shows Bulletin Board pipeline flows for the three LNG export pipeline facilities and the production output at related production facilities in the Roma region.

Figure 5: LNG export pipeline and production flows (TJ)

# **Detailed market analysis**

### Sydney

In Sydney, MOS payments exceeded \$50 000 on 13 June. Increase MOS requirements on the day were the result of participants under forecasting demand inside the hub. The additional supply requirement also drove the higher ex post price of \$9.79/GJ.

On 15 June, an increase in forecast demand and a 32 TJ reduction in offers priced between 4 - 8/GJ led to the ex ante price climbing to 9.44/GJ (from 6.76/GJ forecast the day before).

#### Adelaide

In Adelaide, significant counteracting MOS quantities were allocated across the week leading to service payments in excess of \$50 000 over 4 days.<sup>2</sup> Figure 3.4 shows the large requirements of up to 29.8 TJ of MOS on 12 June, where service payments were just under \$180 000.

On 12 June, SEAGas reported to the AER that it experienced an unexpected high pressure trip affecting deliveries through Cavan. This resulted in reduced flows for a short period during a day of high weekend demand. The pipeline was unable to recover intended flow volumes over the remainder of the gas day leading to some quantity of decrease MOS on the pipeline. SEAGas reported to the AER that a further similar event occurred on 14 June but that since then, in accordance with engineering and monitoring work undertaken, no further events have occurred.<sup>3</sup> SEAGas is continuing efforts to identify the underlying cause.

Additional pressuring out also occurred later in the gas day, likely due to the profiling of gas injections, which resulted in further gas being parked on the pipeline as decrease MOS.<sup>4</sup> Renominations to supply additional gas to the hub on SEAGas during the day may have also had an impact on the quantity of decrease MOS required.<sup>5</sup> This coincided with higher GPG usage in the National Electricity Market (NEM) due to low levels of wind generation across South Australia. Noting the recent increase in MOS payment levels in Adelaide, the AER is monitoring the degree to which GPG may be influencing overall MOS requirements.

#### Victoria

In Victoria, demand climbed above 1 PJ on the 14 and 16 June gas days, resulting in high schedule prices and the injection of LNG. On 16 June, the schedule price reached \$14.89/GJ at 6 pm as demand exceeded participant forecasts across the day.

٠

Total MOS requirements over this period were in excess of 15 TJ/day.

<sup>&</sup>lt;sup>3</sup> Also similar events occurred on 24 May and 7 June.

When the profiled supply of gas into the Adelaide network on SEAGas lags behind demand, additional gas requirements are provided to the hub through the pressure controlled Moomba to Adelaide Pipeline. If flow controlled SEAGas injections are profiled towards the end of the gas day, this can cause those flows to be backed-off when pressure in the network climbs (as demand declines following the peak period).

The additional supply was offsetting nominations to back haul more gas on the Moomba to Adelaide Pipeline.

### 1. Victorian Declared Wholesale Market

In the Victorian gas market, gas is priced five times daily at 6 am, 10 am, 2 pm, 6 pm and 10 pm. The imbalance weighted price on a gas day tends towards the 6 am price<sup>6</sup> which is the schedule at which most gas is traded.

The main drivers<sup>7</sup> of price are demand forecasts and bids to inject or withdraw gas from the market. Figures 1.1 to 1.4 below show the daily prices, demand forecasts<sup>8</sup>, and injection/withdrawal bids for each of the five pricing schedules. Figure 1.5 provides information on which system injection points were used to deliver gas, in turn indicating the location and relative quantity of gas injection bids cleared through the market.

Ancillary payments for gas injected above the market price are shown above in figure 3.

Figure 1.1: Prices by schedule (\$/GJ)

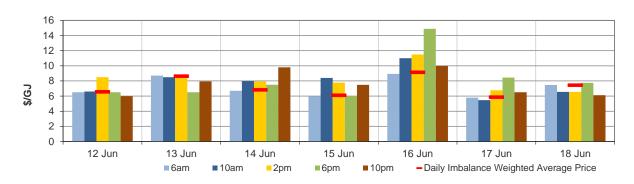

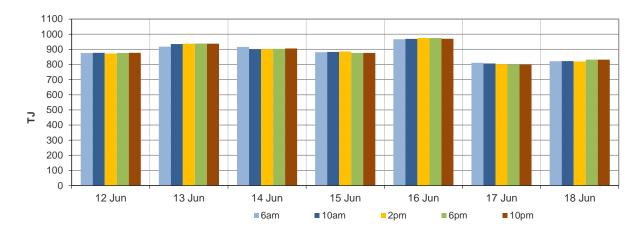

Figure 1.2: Demand forecasts (TJ)

-

Prices for subsequent schedules are applied only to the differences in scheduled quantities (imbalances) to calculate the weighted price. The 6 am price applies to the entire scheduled quantity in the initial schedule.

The price might also be affected by transmission or production (contractual) constraints limiting how much gas can be delivered from a locale or System Injection Point (SIP) from time to time.

These are Market Participants' aggregate demand forecasts adjusted for any override as applied by AEMO from time to time. These forecasts must be scheduled and cannot respond to price like withdrawal bids.

Figure 1.3: Injection bids by price bands (TJ)

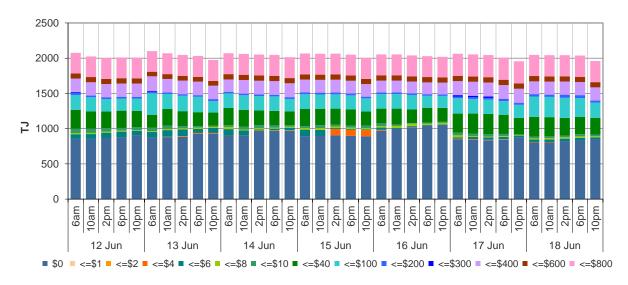

Figure 1.4: Withdrawal bids by price bands (TJ)

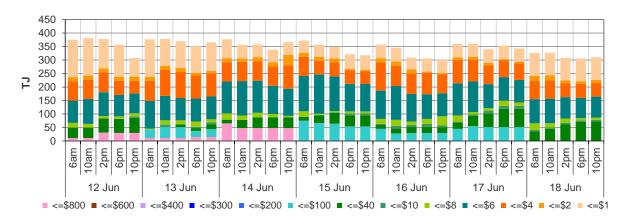

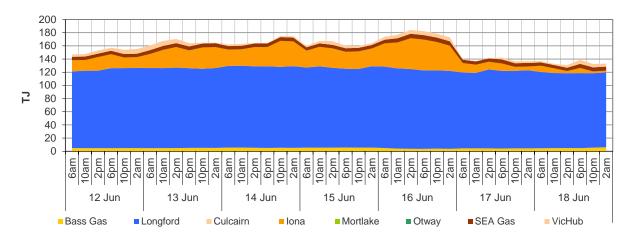

Figure 1.5: Metered Injections by System Injection Point (TJ)

Note that in figure 1.5, the last 8-hour schedule from 10 pm has been separated into two 4-hour blocks to provide a consistent comparison with earlier scheduled injection volumes.

# 2. Sydney STTM

In each STTM hub, a daily gas price is calculated before the gas day (the ex ante price) and after the gas day (the ex post price). The main drivers of these prices are participant demand forecasts, and offers to inject or bids to withdraw gas traded at the hub. Divergences in ex ante and ex post prices for a gas day may occur due to differences in scheduled (forecast) and allocated (actual) quantities. Pipeline acronyms are defined in the user guide.

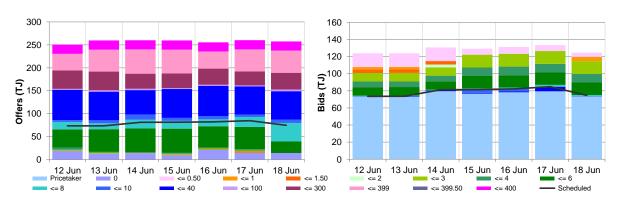

Market Operator Service balancing gas (MOS) payments arise because the amount of gas nominated on pipelines for delivery on a gas day will either exceed or fall short, by some amount, of the amount of gas consumed in the hub. In such circumstances, MOS payments are made to participants for providing a service to park gas on a pipeline or to loan gas from a pipeline to the hub.<sup>10</sup>

Figures 2.1 and 2.2 show daily prices, demand, offers and bids. Figures 2.3 and 2.4 show gas scheduled and allocated on pipelines to supply the hub, indicating the location and relative quantity of gas offers across pipelines and also the amount of MOS allocated for each pipeline.

Figure 2.1: SYD STTM daily ex ante and ex post prices and quantities

	Sun	Mon	Tue	Wed	Thu	Fri	Sat
Ex ante price (\$/GJ)	6.43	7.48	6.77	9.44	6.76	6.80	6.48
Ex ante quantity (TJ)	250	253	277	276	275	275	243
Ex post price (\$/GJ)	7.36	9.79	6.77	9.79	6.76	6.80	6.50
Ex post quantity (TJ)	258	268	277	281	276	278	245

Figure 2.2: SYD daily hub offers and daily hub bids in price bands (\$/GJ)

.

The main driver of the amount of gas scheduled on a gas day is the 'price-taker' bid, which is forecast hub demand that cannot respond to price and which must be delivered, regardless of the price.

MOS service payments involve a payment for a MOS increase service when the actual quantity delivered exceeds final gas nominations for delivery to a hub, and a payment for a MOS decrease service when the actual quantity delivered is less than final nominations. As well as a MOS 'service' payment, as shown in figure 2.4, MOS providers are paid for or pay for the quantity of MOS sold into the market or bought from the market (MOS 'commodity' payments/charges).

Figure 2.3: SYD net scheduled and allocated gas hub supply (excluding MOS)

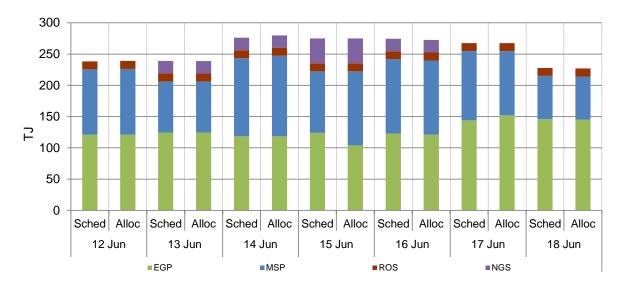

Figure 2.4: SYD MOS allocations (TJ), service payments and commodity payments/charges (\$000)<sup>11</sup>

<sup>-</sup>

The commodity cost of MOS illustrated on the right of the figure represents the commodity quantity at the D+2 ex ante price. Commodity payments and charges for a given gas day relate to quantities traded two days earlier. That is, the commodity cost for services provided on Sunday will appear in the chart for Tuesday, when the D+2 price is set. In contrast, service payments are shown alongside the day they occurred.

# 3. Adelaide STTM

The Adelaide STTM hub functions in the same way as the Sydney STTM hub. The same data that was presented for the Sydney hub is presented for the Adelaide hub in the figures below.

Figure 3.1: ADL STTM daily ex ante and ex post prices and quantities

	Sun	Mon	Tue	Wed	Thu	Fri	Sat
Ex ante price (\$/GJ)	7.40	7.76	7.05	7.90	7.39	7.60	7.41
Ex ante quantity (TJ)	74	74	81	82	82	85	75
Ex post price (\$/GJ)	7.20	9.46	6.55	7.79	7.07	7.07	7.08
Ex post quantity (TJ)	73	81	80	79	79	77	70

Figure 3.2: ADL daily hub offers and daily hub bids in price bands (\$/GJ)

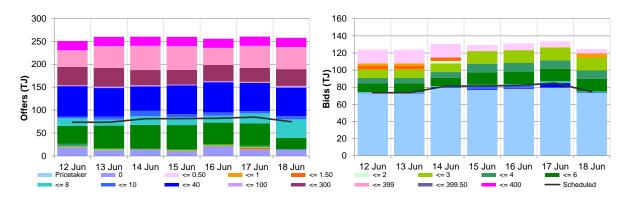

Figure 3.3: ADL net scheduled and allocated gas hub supply (excluding MOS)

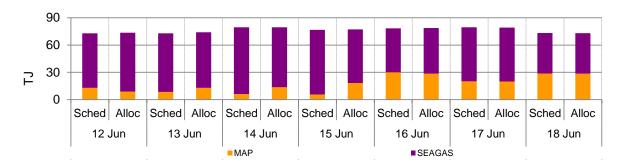

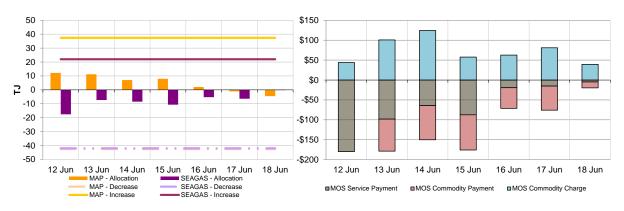

Figure 3.4: ADL MOS allocations (TJ), service payments and commodity payments/charges (\$000)

### 4. Brisbane STTM

The Brisbane STTM hub functions in the same way as the Sydney STTM hub. The same data that was presented for the Sydney hub is presented for the Brisbane hub in the figures below.

Figure 4.1: BRI STTM daily ex ante and ex post prices and quantities

	Sun	Mon	Tue	Wed	Thu	Fri	Sat
Ex ante price (\$/GJ)	6.95	6.95	6.95	6.85	6.95	7.05	7.50
Ex ante quantity (TJ)	82	95	98	99	91	85	79
Ex post price (\$/GJ)	6.95	6.95	6.95	6.85	7.05	7.18	7.50
Ex post quantity (TJ)	79	93	94	99	101	91	77

Figure 4.2: BRI daily hub offers and daily hub bids in price bands (\$/GJ)

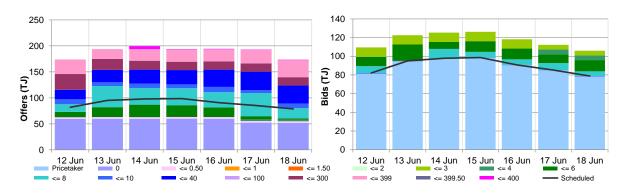

Figure 4.3: BRI net scheduled and allocated gas hub supply (excluding MOS)

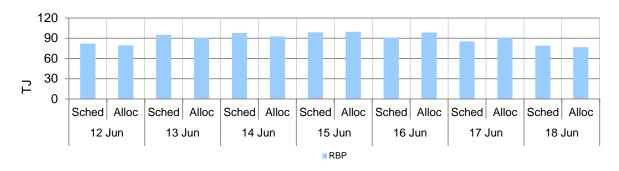

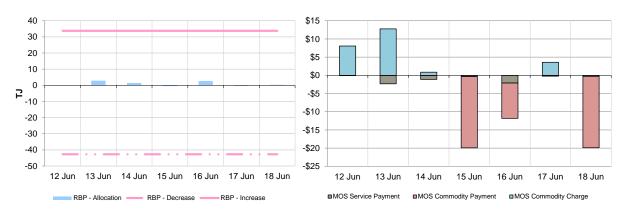

Figure 4.4: BRI MOS allocations (TJ), service payments and commodity payments/charges (\$000)

### 5. National Gas Bulletin Board

Figure 5.1 shows average daily actual flows for the current week<sup>12</sup> from the Bulletin Board (changes from the previous week's average are shown in brackets). Average daily prices<sup>13</sup> are provided for gas markets and gas supply hubs. Average daily quantities are provided for gas powered generation for each region.

Figure 5.1: Gas market data (\$/GJ, TJ); Production and Pipeline flows (TJ)

<sup>1</sup> 

Domestic gas flows are calculated as the total of: SA = MAP + SEAGAS; VIC = SWP + LMP + (absolute quantity of negative flows only on the 'NSW-VIC interconnect'); NSW/ACT = EGP + MSP; TAS = TGP; QLD (Brisbane) = RBP; QLD (Mt Isa) = CGP; and QLD (Gladstone) = QGP.

**Export gas flows** are calculated as the total of: the APLNG pipeline; the GLNG pipeline; and the Wallumbilla to Gladstone pipeline.

GPG volumes may include gas usage that does not show up on Bulletin Board pipeline flows.

GSH supply is the average daily volume of gas 'traded', while price is a volume weighted average.

# 6. Gas Supply Hub

The Gas Supply Hub (GSH) was established in March 2014 for the trading of gas at Wallumbilla. The GSH is a voluntary market<sup>14</sup> for the supply of gas traded<sup>15</sup> between separate participants, with products listed for sale and purchase at delivery points on three major connecting pipelines at Wallumbilla - the QGP, the SWQP and the RBP. There are separate products for each pipeline (each pipeline is considered a trading location, and each has a number of delivery points) and delivery period (daily, day-ahead, balance-of-day, weekly and monthly products). In June 2016, a new supply hub at Moomba was created to facilitate trade on the MAP and MSP, and also allow for trading between the Wallumbilla and Moomba markets on the SWQP through a spread product (representing the price differential between the two hubs).

There were 12 trades this week for 123 TJ of gas at a volume weighted price of \$7.18/GJ in the Wallumbilla hub. Trades of 115 TJ on the SWQP consisted of balance-of-day, day-ahead and daily products (\$7.13/GJ) while one daily product was traded on the RBP at \$7.90/GJ.

Figure 6.1 shows the quantity of gas traded by product type for each trading day on pipeline trading locations in the Wallumbilla and Moomba Gas Supply Hubs.

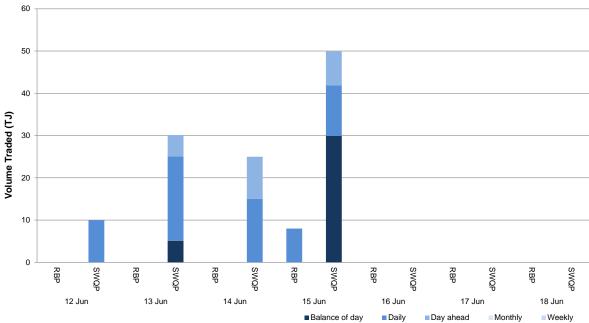

Figure 6.1: GSH traded quantities

**Australian Energy Regulator July 2016** 

Market trade is facilitated through an electronic trading platform, with standardised terms and conditions and a market settlement facility for the short-term trading of physical gas and related products. The market is designed to complement existing bilateral gas supply arrangements and gas transportation agreements, through the placement of anonymous offers (to sell) or bids (to buy) at specified quantity and price increments, which are automatically matched on the exchange to form transactions.

<sup>15</sup> Volume weighted average prices and traded quantities provided in this report may include off-market trades, which are not included in AEMO's reference price calculations.
