

# 13 - 19 August 2017

### Introduction

The AER is required to publish the reasons for significant variations between forecast and actual price and is responsible for monitoring activity and behaviour in the National Electricity Market. The Electricity Report forms an important part of this work. The report contains information on significant price variations, movements in the contract market, together with analysis of spot market outcomes and rebidding behaviour. By monitoring activity in these markets, the AER is able to keep up to date with market conditions and identify compliance issues.

## **Spot market prices**

Figure 1 shows the spot prices that occurred in each region during the week 13 – 19 August 2017.

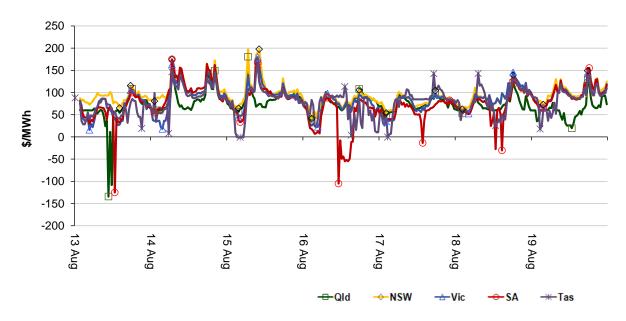

Figure 2 shows the volume weighted average (VWA) prices for the current week (with prices shown in Table 1) and the preceding 12 weeks, as well as the VWA price over the previous 3 financial years.

160 140 0 120 100 \$/MWh  $\Diamond$ 80 9 60 40 20 0 14/15 FY Current week 28 May 15/16 FY Previous weel

Figure 2: Volume weighted average spot price by region (\$/MWh)

Table 1: Volume weighted average spot prices by region (\$/MWh)

NSW

Region	Qld	NSW	Vic	SA	Tas
Current week	75	96	87	77	80
16-17 financial YTD	56	61	58	184	59
17-18 financial YTD	78	94	112	109	109

Longer-term statistics tracking average spot market prices are available on the AER website.

# **Spot market price forecast variations**

---Qld

The AER is required under the National Electricity Rules to determine whether there is a significant variation between the forecast spot price published by the Australian Energy Market Operator (AEMO) and the actual spot price and, if there is a variation, state why the AER considers the significant price variation occurred. It is not unusual for there to be significant variations as demand forecasts vary and participants react to changing market conditions. A key focus is whether the actual price differs significantly from the forecast price either four or 12 hours ahead. These timeframes have been chosen as indicative of the time frames within which different technology types may be able to commit (intermediate plant within four hours and slow start plant within 12 hours).

There were 196 trading intervals throughout the week where actual prices varied significantly from forecasts. This compares to the weekly average in 2016 of 273 counts and the average in 2015 of 133. Reasons for the variations for this week are summarised in Table 2. Based on AER analysis, the table summarises (as a percentage) the number of times when the actual price differs significantly from the forecast price four or 12 hours ahead and the major reason for that variation. The reasons are classified as availability (which means that there is a change in the total quantity or price offered for generation), demand forecast inaccuracy, changes to network capability or as a combination of factors (when there is not one dominant reason). An instance where both four and 12 hour ahead forecasts differ significantly from the actual price will be counted as two variations.

Table 2: Reasons for variations between forecast and actual prices

	Availability	Demand	Network	Combination
% of total above forecast	2	10	0	2
% of total below forecast	64	16	0	5

Note: Due to rounding, the total may not be 100 per cent.

# **Generation and bidding patterns**

The AER reviews generator bidding as part of its market monitoring to better understand the drivers behind price variations. Figure 3 to Figure 7 show the total generation dispatched and the amounts of capacity offered within certain price bands for each 30 minute trading interval in each region.

Figure 3: Queensland generation and bidding patterns

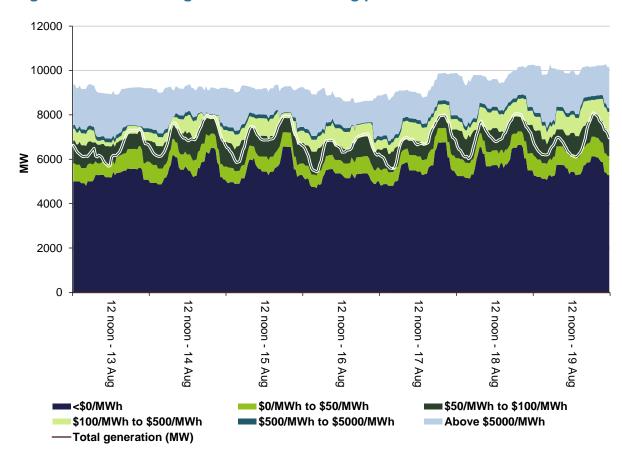

Figure 4: New South Wales generation and bidding patterns

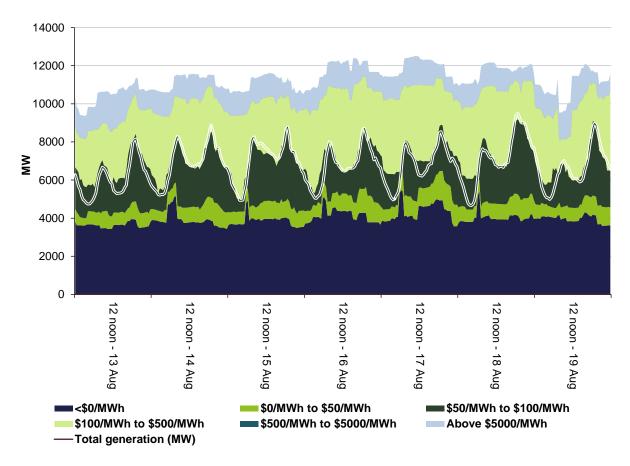

Figure 5: Victoria generation and bidding patterns

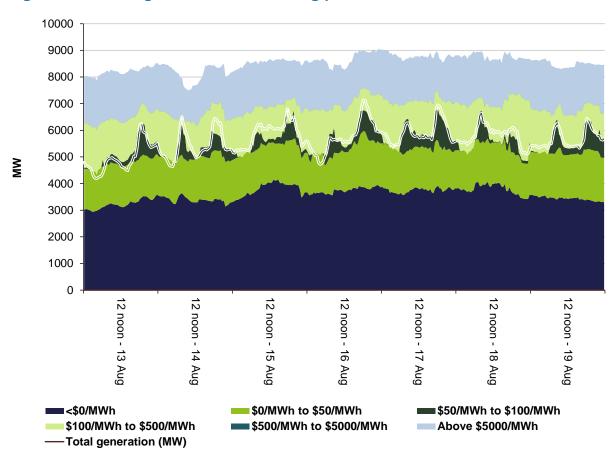

Figure 6: South Australia generation and bidding patterns

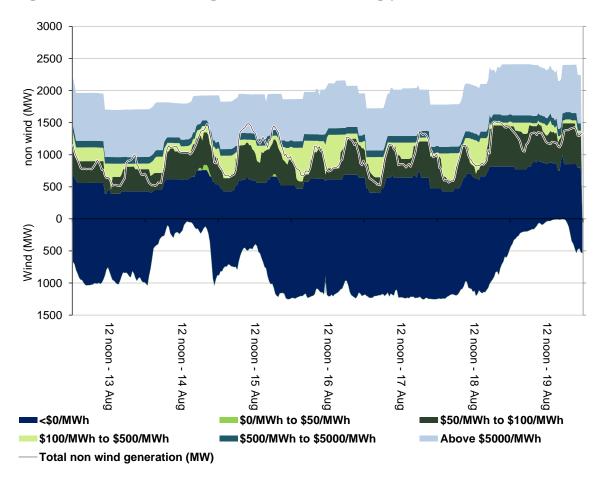

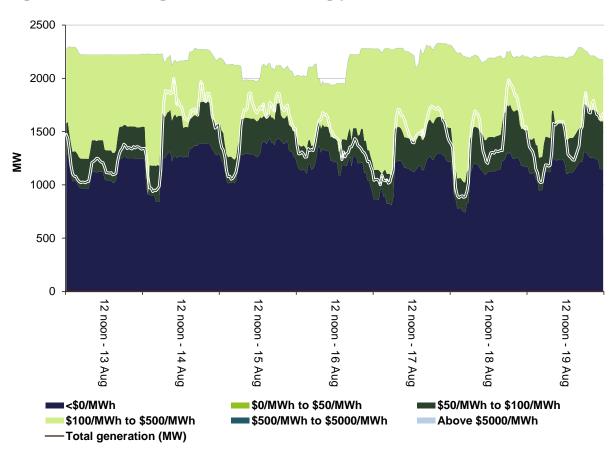

Figure 7: Tasmania generation and bidding patterns

## Frequency control ancillary services markets

Frequency control ancillary services (FCAS) are required to maintain the frequency of the power system within the frequency operating standards. Raise and lower regulation services are used to address small fluctuations in frequency, while raise and lower contingency services are used to address larger frequency deviations. There are six contingency services:

- fast services, which arrest a frequency deviation within the first 6 seconds of a contingent event (raise and lower 6 second)
- slow services, which stabilise frequency deviations within 60 seconds of the event (raise and lower 60 second)
- delayed services, which return the frequency to the normal operating band within 5 minutes (raise and lower 5 minute) at which time the five minute dispatch process will take effect.

The Electricity Rules stipulate that generators pay for raise contingency services and customers pay for lower contingency services. Regulation services are paid for on a "causer pays" basis determined every four weeks by AEMO.

The total cost of FCAS on the mainland for the week was \$4 078 500 or around one per cent of energy turnover on the mainland.

The total cost of FCAS in Tasmania for the week was \$1 088 500 or around six per cent of energy turnover in Tasmania.

Figure 8 shows the daily breakdown of cost for each FCAS for the NEM, as well as the average cost since the beginning of the previous financial year.

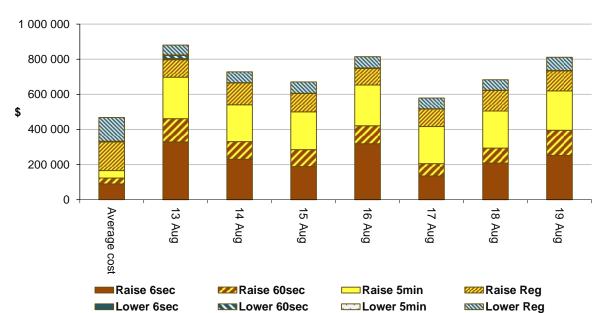

Figure 8: Daily frequency control ancillary service cost

## Detailed market analysis of significant price events

#### Queensland

There were two occasions where the spot price in Queensland was below -\$100/MWh.

### Sunday, 13 August

**Table 3: Price, Demand and Availability** 

Time	Price (\$/MWh)			Demand (MW)			Availability (MW)		
	Actual	4 hr forecast	12 hr forecast	Actual	4 hr forecast	12 hr forecast	Actual	4 hr forecast	12 hr forecast
11 am	-134.42	16.79	16.79	5026	5047	5013	8955	9070	9235
Midday	-108.36	13.80	13.80	4893	4897	4872	8940	9062	9227

Conditions at the time saw demand and availability close to that forecast four hours ahead.

Constraints managing frequencies on the Queensland network, due to a planned outage on the Liddell to Muswellbrook line in New South Wales started to bind from 7.20 am.

At 10.40 am the constraints forced a 97 MW change in flows across the Terranora interconnector. Terranora went from exporting 73 MW into New South Wales at 10.35 am to importing 24 MW into Queensland from New South Wales at 10.40 am. This resulted in a decrease in generation in Queensland and coupled with a small decrease in demand saw the dispatch price fall to -\$918/MWh at 10.40 am.

At 11.40 am flows across QNI into New South Wales decreased by 50 MW and demand decreased by 34 MW. This resulted in a decrease in generation in Queensland and with higher priced generation either ramp rate limited or stranded in FCAS and unable to set price, the dispatch price decreased to -\$918/MWh.

#### South Australia

There were two occasions where the spot price in South Australia was below -\$100/MWh.

### Sunday, 13 August

Table 4: Price, Demand and Availability

Time	Price (\$/MWh)			Demand (MW)			Availability (MW)		
	Actual	4 hr forecast	12 hr forecast	Actual	4 hr forecast	12 hr forecast	Actual	4 hr forecast	12 hr forecast
1 pm	-125.14	75.94	63.42	769	870	832	2623	2616	2627

Conditions at the time saw demand around 100 MW lower than forecast while availability was close to forecast four hours ahead.

There was only a small amount of capacity priced between \$90/MWh and the floor. This meant small changes in demand and supply could result in large variations in price.

At 12.45 pm, there was a small reduction in exports to Victoria and a small increase in wind generation, priced at the floor. As a result the dispatch price decreased to the floor. At 12.50 pm the dispatched price returned to previous levels as wind generation fell by 46 MW and demand increased by 8 MW.

#### Wednesday, 16 August

**Table 5: Price, Demand and Availability** 

Time	Price (\$/MWh)			Demand (MW)			Availability (MW)		
	Actual	4 hr forecast	12 hr forecast	Actual	4 hr forecast	12 hr forecast	Actual	4 hr forecast	12 hr forecast
11.30 am	-105.15	75.89	82.71	1115	1076	1104	3056	2942	2945

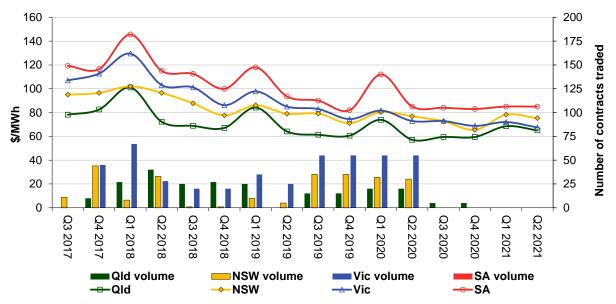

Conditions at the time saw demand around 40 MW higher and availability around 115 MW higher than forecast four hours ahead.

At 11.15 am a constraint which limits the amount of wind generation in South Australia stopped binding and wind generation increased by around 140 MW. With higher priced generation either ramp down limited or trapped in FCAS, the price decreased to the floor for one dispatch interval. The price increased to around \$70/MWh at 11.20 am when participants (including two wind farms) rebid over 300 MW of capacity from negative prices and \$66/MWh to above \$100/MWh. The reasons related to the dispatch price being at the price floor.

#### **Financial markets**

Figure 9 shows for all mainland regions the prices for base contracts (and total traded quantities for the week) for each quarter for the next four financial years.

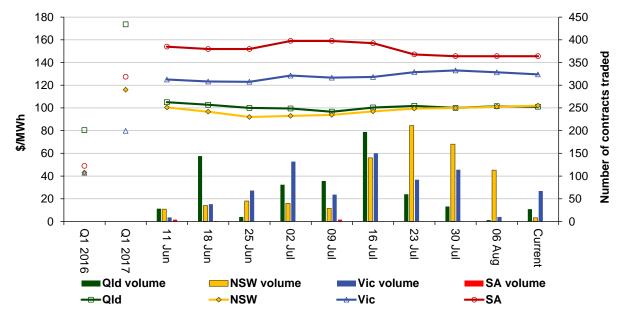

Figure 9: Quarterly base future prices Q3 2017 - Q2 2021

Source. ASXEnergy.com.au

Figure 10 shows how the price for each regional Q1 2018 base contract has changed over the last 10 weeks (as well as the total number of trades each week). The closing quarter 1 2016 and quarter 1 2017 prices are also shown. The AER notes that data for South Australia is less reliable due to very low numbers of trades.

Figure 10: Price of Q1 2018 base contracts over the past 10 weeks (and the past 2 years)

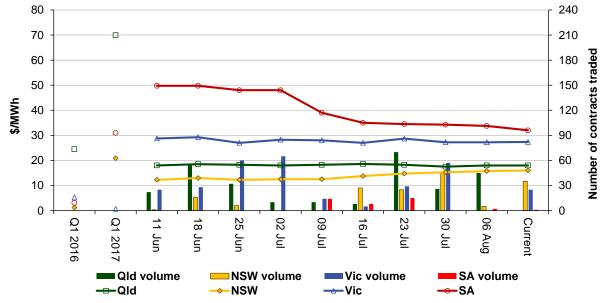

Note. Base contract prices are shown for each of the current week and the previous 9 weeks, with average prices shown for periods 1 and 2 years prior to the current year.
