Canberra ACT 2601

Via email: Mike.Buckley@acc.gov.au

Dear Mr. Buckley

Public Lighting Schedules calculated for the AER

The AER's draft determination received on 28 November 2008 outlines the AER's intention to apply six "tariff classes" for public lighting in the 2009-14 period. The draft determination did not calculate prices using its proposed part building block / part annuity approach but requested EnergyAustralia to calculate prices for each of the tariff classes proposed by the AER.

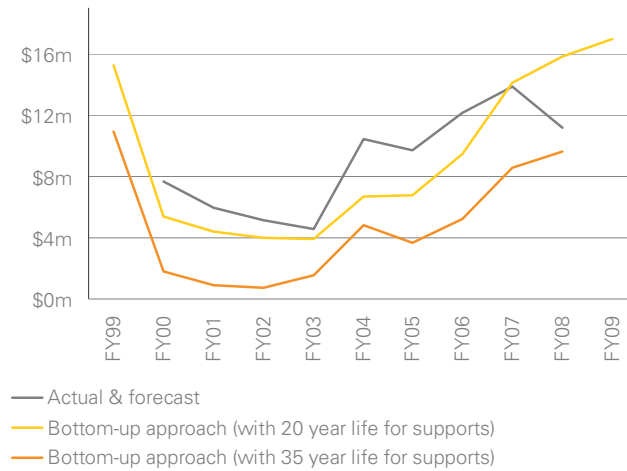

We have calculated the tariff classes in accordance with our understanding of your requirements as outlined in the draft determination document. The price schedules are included in Attachment 1.

It should be noted that EnergyAustralia provides this information in response to your request and does not endorse their application. As you are aware, we have not revised our proposal in relation to public lighting and remain of the view that the methodology and prices we put forward in our original June 2008 remain appropriate. We also note that the prices put forward by EnergyAustralia are lower than the prices generated by the AER's approach. We cannot support a pricing method that results in customers paying more than what we believe is an efficient price for public lighting services.

In its draft determination, the AER did not provide guidance on the roll forward approach, nor how EnergyAustralia should establish the remaining life of the public lighting asset base in the absence of detailed component specific age information. Our approach is briefly explained below.

EnergyAustralia's asset records show the date on which each public light in service was initially constructed. However, we do not have sufficiently reliable data about when each component has been replaced. To establish a remaining life, we have assumed that each public light has been replaced at the end of its standard life (typically 20 years). This approach would not be robust for an individual light because some components are replaced before and some are replaced after they reach their standard life. However when applied across 1.3 million public lighting components EnergyAustralia considers this assumption to be robust.

The robustness of the remaining life assumption can be checked by comparing actual capital expenditure against a profile of capital expenditure derived from the remaining life assumption.

The figure¹ above shows that the profile of capital expenditure derived from the remaining life assumption follows the last ten years of capital expenditure incurred by EnergyAustralia. It therefore indicates that EnergyAustralia's approach to establish the remaining life of its public lighting asset base is appropriate.

We hope that this information assists the AER in its decision making process. If you have any enquiries about this matter please contact me on (02) 9269 4171.

Yours sincerely

Catherine O'Neill
Executive Manager – Network Pricing & Regulation
