WEEKLY ELECTRICITY MARKET ANALYSIS

20 March - 26 March 2011

Summary

In Queensland the spot price averaged \$37/MWh. Weekly average spot prices ranged from \$21/MWh to \$27/MWh in other regions.

AUSTRALIAN ENERGY

REGULATOR

Spot market prices

Figure 1 sets out the volume weighted average (VWA) prices for the week 20 March to 26 March and the 10/11 financial year to date (YTD) across the NEM. It compares these prices with price outcomes from the previous week and year to date respectively.

Figure 1: Volume weighted average spot price by region (\$/MWh)

	Qld	NSW	VIC	SA	Tas
Average price for 20 Mar - 26 Mar 2011	37	27	25	21	24
% change from previous week*	46	1	-3	-21	-9
10/11 financial YTD	36	48	29	45	31
% change from 09/10 financial YTD **	-14	-20	-29	-54	13

*The percentage change between last week's average spot price and the average price for the previous week. Calculated on VWA prices prior to rounding.

**The percentage change between the average spot price for the current financial year and the average spot price for the previous financial year. Percentage changes are calculated on VWA prices prior to rounding.

Further information is provided in Appendix A when the spot price exceeds three times the weekly average and is above 250/MWh, or is below -100/MWh. Longer term market trends are attached in Appendix B¹.

Financial markets

Figures 2 to 9 show futures contract² prices traded on the Sydney Futures Exchange (SFE) as at close of trade on Monday 28 March 2011. Figure 2 shows the base futures contract prices for the next three calendar years, and the average over these three years. Also shown are percentage changes³ from the previous week.

³ Calculated on prices prior to rounding.

¹ Monitoring the performance of the wholesale market is a key part of the AER's role and an overview of the market's performance in the long term is provided on the AER website. Long-term statistics can be found there on, amongst other things, demand, spot prices, contract prices and frequency control ancillary services prices. To access this information go to

www.aer.gov.au -> Monitoring, reporting and enforcement -> Electricity market reports -> Long-term analysis. ² Futures contracts traded on the SFE are listed by d-cyphaTrade (<u>www.d-cyphatrade.com.au</u>). A futures contract is typically for one MW of electrical energy per hour based on a fixed load profile. A base load profile is defined as the base load period from midnight to midnight Monday to Sunday over the duration of the contract quarter. A peak load profile is defined as the peak-period from 7 am to 10 pm Monday to Friday (excluding Public holidays) over the duration of the contract quarter. ³ Cele base housing the peak-period from the contract quarter.

Source: d-cyphaTrade www.d-cyphatrade.com.au

Figures 6-9 compare for each region the closing daily base contract prices for the first quarter of 2007, 2008, 2009, 2010 and 2011. Also shown is the daily volume of Q1 2011 base contracts traded. The vertical dashed line signifies the start of the Q1 period for which the contracts are being purchased. To understand the diagrams, the dark-blue line in figure 6 demonstrates that throughout the middle of 2007, the market had an expectation of very high spot prices in the first quarter of 2008.

*The daily volume scale for South Australia is smaller than for other regions to reflect the lower liquidity in the market in South Australia.

Spot market forecasting variations

The AER is required under the National Electricity Rules to determine whether there is a significant variation between the forecast spot price published by the Australian Energy Market Operator (AEMO) and the actual spot price and, if there is a variation, state why the AER considers the significant price variation occurred. It is not unusual for there to be significant variations as demand forecasts vary and as participants react to changing market conditions. There were 75 trading intervals throughout the week where actual prices varied significantly from forecasts⁵. This compares to the weekly average in 2010 of 57 counts and the average in 2009 of 103. Reasons for these variances are summarised in Figure 10⁶.

	Availability	Demand	Network	Combination
% of total above forecast	0	14	0	2
% of total below forecast	46	36	0	3

⁵ A trading interval is counted as having a variation if the actual price differs significantly from the forecast price either four or 12 hours ahead.

⁶ The table summarises (as a percentage) the number of times when the actual price differs significantly from the forecast price four or 12 hours ahead and the major reason for that variation. The reasons are classified as availability (which means that there is a change in the total quantity or price offered for generation), demand forecast inaccuracy, changes to network capability or as a combination of factors (when there is not one dominant reason). An instance where both four and 12 hour ahead forecasts differ significantly from the actual price will be counted as two variations.

Demand and bidding patterns

The AER reviews demand, network limitations and generator bidding as part of its market monitoring to better understand the drivers behind price variations. Figure 11 shows the weekly change in total available capacity at various price levels during peak periods⁷. For example, in Queensland 620 MW less capacity was offered at prices under \$20/MWh this week compared to the previous week. Also included is the change in average demand during peak periods, for comparison.

MW	<\$20/MWh	Between \$20 and \$50/MWh	Total availability	Change in average demand
QLD	-620	172	-763	203
NSW	29	-148	-280	75
VIC	333	73	248	286
SA	79	-153	4	-12
TAS	110	137	97	-96
TOTAL	-69	81	-694	456

Figure 11: Changes in available generation and average demand compared to the previous week during peak periods

Ancillary services market

The total cost of frequency control ancillary services (FCAS) on the mainland for the week was \$298 000 or less than one per cent of energy turnover on the mainland.

The total cost of FCAS in Tasmania for the week was \$102 000 or 2.5 per cent of energy turnover in Tasmania.

Figure 12 shows the daily breakdown of cost for each FCAS for the NEM.

Figure 12: Daily frequency control ancillary service cost

Australian Energy Regulator April 2011

⁷ A peak period is defined as between 7 am and 10 pm on weekdays.

Queensland:

There was one occasion where the spot price in Queensland was greater than three times the Queensland weekly average price of \$37/MWh and above \$250/MWh, and one occasion where the spot price in Queensland was below \$-100/MWh.

Sunday, 20 March

2.00 PM	Actual	4 hr forecast	12 hr forecast
Price (\$/MWh)	1561.04	25.67	26.01
Demand (MW)	6070	6206	6281
Available capacity (MW)	10 038	10 096	10 115

At 1.55 pm a constraint managing the overload of the Calvale to Wurdong 275 kV on the loss of the Calvale Stanwell line, violated as result of a reduction in the dynamic rating of the Calvale to Stanwell 275 kV line. This saw imports into Queensland decrease by over 150 MW in five minutes before returning to previous levels. A large amount of negatively priced generation was also constrained off. The step change resulted in a 5-minute price spike to \$9218/MWh at 1.55 pm.

There was no significant rebidding.

Friday, 25 March

5.30 AM	Actual	4 hr forecast	12 hr forecast
Price (\$/MWh)	-151.45	24.81	24.01
Demand (MW)	4946	5049	5070
Available capacity (MW)	9759	10 165	10 305

In preparation for a planned outage of the Armidale to Tamworth 330 kV transmission line scheduled from 5.30 am, a ramping constraint was invoked by AEMO to reduce interconnector transfers to New South Wales. This saw flows across QNI at 5.20 am fall by 159 MW from the previous dispatch interval. Flows on the Directlink interconnector were also limited by a similar ramping constraint, with flows decreasing by 80 MW.

The sudden drop in exports saw Queensland generators reduced at their ramp down rates and the 5-minute price decrease to the price floor at 5.20 am. The 5-minute price subsequently increased to zero before returning to positive levels from 5.30 am onwards.

There was no significant rebidding.
